The Three R's of CEDAW Commitment: Ratification, Reservation, and Rejection

Abstract: Human rights treaties have mixed success records for improving member states' human rights behavior. Yet the Convention on the Elimination of all forms of Discrimination Against Women (CEDAW) has been successful for improving women's rights. However, few CEDAW analyses account for the influence of reservations on state compliance with the treaty. This study develops a theoretical approach drawn from the opposability (vs. permissibility) school of reservations in international law. We argue that states ratifying CEDAW with reservations are less likely to see improvements in women's rights than states ratifying CEDAW without reservations. We also show that states with worse women's rights place reservations on core articles most central to the treaty's success, while states with better women's rights place reservations on procedural or non-core articles. Ordered logit, regression, and Heckman selection models of state-year data from 1981-2019 show that reservations in CEDAW are detrimental to the success of the institution.

Key Words: Commitment, CEDAW, Reservations, Women's Rights, Ratification

1
2
3
4 When states ratify human rights treaties, how often do they comply with them? How does the
5 level of commitment to the treaty influence compliance? For example, some ratifying states fully
6 commit to a human rights treaty, while others may ratify but place legal reservations on one or
7 more treaty articles. While a state may view treaty ratification as a low-cost opportunity signal
8 that indicates its support for the international human rights regime (Simmons 2009), such
9 “window dressing” does not necessarily translate into treaty compliance (Hathaway 2002).

17

18 We examine how the level of commitment to the Convention on the Elimination of All
19 Forms of Discrimination Against Women (CEDAW) treaty affects the treatment of women in
20 member states. Since being signed in 1979 and entering into legal force in September 1981,
21 CEDAW has advanced women’s social, political, and economic rights around the world, even
22 though some women still face detrimental obstacles when it comes to receiving an equal
23 education, reproductive healthcare, voting rights, equal work for equal pay, property rights, and
24 fair childcare/marriage laws.

32
33

34 The CEDAW convention has fourteen articles that cover the civil rights and legal status
35 of women, as well as reproductive rights and the impact of cultural factors on gender relations
36 (OHCHR 2019). Article 2, one of the core provisions of the treaty, commits states members to
37 eliminating discrimination against women using legal, legislative, and other means. In the area of
38 legal rights, CEDAW focuses on women’s right to vote and hold public office (Article 7), legal
39 privileges surrounding marital status (Article 16), non-discrimination in education (Article 10)
40 and employment (Article 11), the right to choose a spouse (Article 16), parental rights (Articles
41 11 and 16), and personal and property rights (Article 16). Another major concentration of
42 CEDAW is women’s reproductive rights. Throughout the treaty, reproductive choice, childcare,
43 maternity protection, and shared responsibility in childrearing are highlighted (Articles 4, 5, 11).

58
59
60

1
2
3
4 CEDAW also focuses on the influence of culture and tradition that may put constraints on
5
6 women's advancement. It works to challenge discrimination that women may face in their day to
7
8 day lives including stereotyping and micro-aggressions (Article 10).
9

10
11 The enactment of the CEDAW convention is monitored by the Committee of the
12
13 Elimination of Discrimination Against Women, which was established in Article 17 (De Pauw
14
15 2013, 57). States that are participating in the convention are expected to submit a national report
16
17 to the committee, showing how they have adopted the provisions of the convention. Signing but
18
19 not ratifying the treaty sends the signal that a state may agree with what is in the document, but it
20
21 is not willing to be held legally accountable by the Committee. The United States, for example,
22
23 has signed CEDAW, but it has not ratified the human rights treaty. However, the US is unique in
24
25 this regard, because 189 states ratified or acceded to CEDAW by 2023, indicating a willingness
26
27 by most countries in the world to be legally bound by the treaty (OHCHR 2019). In terms of
28
29 what the Committee views as core articles for the CEDAW treaty, it 'has, during the review of
30
31 many periodic reports, determined that reservations to articles 2, 7, 9 and 16, as well as general
32
33 reservations, are incompatible with the Convention's object and purpose' (De Pauw 2013, 59).¹
34
35
36
37
38

39 Does the treaty work? Some scholars find that ratification of human rights treaties in
40
41 general has little effect on states' human rights practices (Hathaway 2007). However, studies
42
43 focusing on CEDAW find more evidence of treaty compliance, with CEDAW ratifying states
44
45 having significantly higher women's political, social, and economic rights than countries that do
46
47 not ratify the convention (Cole 2009; Simmons 2009; Hill 2010; Lupu 2013; Cho 2014).
48
49

50 However, the question of level of commitment to the treaty has yet to be fully analyzed. Can a
51
52
53

54
55 ¹ The general reservation most discussed by the Committee relates to Article 29, which articulates conflict
56 management procedures (e.g., arbitration).
57

1
2
3
4 treaty commitment that has reservations on core articles of the treaty be counted the same as one
5
6 that does not? We find that reservations and level of commitment to the CEDAW convention
7
8 have significant consequences for the livelihood of women in those countries.²
9
10

11 Among ratifying states, there is significant variation in the use of reservations on articles
12
13 of the CEDAW treaty. Table 1 shows commitment levels to CEDAW from 1980-2022 using
14
15 state year as the unit of analysis. 31 percent of countries ratifying CEDAW do so with
16
17 reservations, comprising 24% of all state year observations. While previous studies have found
18
19 that CEDAW membership improves women's rights overall (e.g., Simmons 2009; Hill 2010),
20
21 scholars do not typically take the level of commitment into account. Our study fills this gap by
22
23 examining how reservations influence treaty compliance and by examining which types of
24
25 reservations are most detrimental to CEDAW's mission.

41 Our article is organized as follows. We begin by reviewing the literature on compliance
42
43 with human rights treaties, generally and for CEDAW, and we discuss how reservations
44
45 influence compliance. This is followed by the theory section where we connect the use of
46
47 reservations in treaties more broadly to the opposability and permissibility perspectives in
48
49 international law. We argue that states ratifying human rights treaties with reservations will

54
55 ² “Reservations are the means by which nations alter or exclude treaty terms to individually limit the
56
57 obligation or effect of the treaty.” Piper (1985, 296)
58
59
60

1
2
3
4 exhibit lower compliance levels than those who join treaties without reservations (or do not join
5
6 at all). We also argue that states with better human rights will use procedural reservations more
7
8 often, while states with worse rights will place reservations on core articles that are central to the
9
10 success of a human rights treaty. Empirical analyses (ordered logit, regression, and Heckman
11
12 selection models) of state commitments to CEDAW confirm our hypotheses, with women's
13
14 rights being best for states who ratify the treaty without reservations. We conclude with some
15
16 thoughts on directions for future work.

23 **LITERATURE REVIEW**

24 The Puzzle of Non-Compliance with Human Rights Treaties

25
26
27 The international human rights regime has witnessed the creation of dozens of treaties
28
29 and international criminal courts in the past few decades. While the expectation is that countries
30
31 that join human rights treaties or courts will improve human rights protections in the domestic
32
33 sphere, many quantitative analyses show a weak or even negative effect of human rights treaties
34
35 on human rights behavior (e.g., Keith 1999; Hafner-Burton and Tsutsui 2005; Hathaway 2002).
36
37 This puzzle has been explained with multiple arguments, along with a recognition that the
38
39 standards and measures for human rights may themselves shift over time (Fariss 2019).
40
41
42

43
44 One argument is that states that join human rights treaties are motivated by different
45
46 domestic forces. We can identify a set of states who are true non-compliers and prefer to engage
47
48 in mass repression and another set of states (true compliers) who are generally compliant with
49
50 human rights, but who may place legal limitations (e.g., reservations) on international treaties
51
52 because of strong domestic legal enforcement provisions. "States with robust domestic rule of
53
54 law might shy away from committing to international treaties because treaty commitments will
55
56
57

1
2
3
4 be effective” (Hathaway 2007, 612). The aggregated patterns for treaty compliance may be
5
6 similar between the two groups if some of the true non-compliers behave similarly to the true
7
8 compliers due to domestic institutions.
9

10
11 A second argument focuses on external pressures that may encourage true non-compliers
12
13 to ratify human rights treaties, even though their intentions to comply with the treaty’s provisions
14
15 are weak. States often face international social pressure for ratifying human rights treaties
16
17 (Avdeyeva 2007), but they may be less likely to implement the treaty through domestic policy
18
19 changes if they join for international signaling purposes (Cole 2009) or if they feel coerced into
20
21 doing so (Wotipka and Tsutsui 2008). Goodliffe and (2006) note that countries may join human
22
23 rights treaties to signal that they are credible to other states in the international system, which is
24
25 why new democracies may sign onto these treaties to “lock-in” their commitment to democratic
26
27 principles. Human rights treaties in the aggregate may appear to have weak compliance rates if
28
29 external pressures lead to true compliers and true non-compliers joining the treaties at similar
30
31 rates but having different compliance intentions.
32
33
34
35

36
37 A third perspective focuses on domestic enforcement mechanisms. Even if states wanted
38
39 to implement changes in policy and follow human rights treaty content, it can be extremely
40
41 costly. Hathaway (2002) argues that non-democratic countries are less likely to adhere to treaties
42
43 due to these costs; democracies and states with effective legal systems follow human rights
44
45 treaties because of strong internal pressure and monitors (Neumayer 2005). This explains why
46
47 states with weak judicial independence often ratify human rights treaties but violate them
48
49 regularly (Powell and Staton 2009), and why high rule of law states place many reservations on
50
51 human rights treaties (Simmons 2009; Hill 2016). Yet, high rule of law countries are more likely
52
53
54
55
56
57
58
59
60

1
2
3
4 to be true compliers in terms of human rights preferences, and thus they should avoid
5
6 reservations on core articles that are essential to the success of a human rights treaty.
7

8 9 CEDAW's Compliance Record

10
11 While the human rights treaty literature often finds weak compliance patterns, the
12
13 empirical record examining the effects of the CEDAW treaty on women's rights is much
14
15 stronger. In large N analyses, Simmons (2009) shows that CEDAW produced significant
16
17 improvements in women's education, reproductive, and employment rights over time for states
18
19 members. She points to the cases of Colombia where CEDAW helped women gain access to
20
21 reproductive health and Japan where CEDAW helped women leverage the legal system in their
22
23 favor. Using matching techniques for 165 states from 1976-2006, Hill (2010) also finds that
24
25 CEDAW ratification significantly improves women's political rights, although he finds weaker
26
27 effects for social and economic rights. Controlling for states' overall preferences for joining
28
29 human rights treaties, Lupu's (2013) matching analysis shows that CEDAW members see
30
31 significant improvements in women's political, social, and economic rights. On the other hand,
32
33 Hill (2010) and Lupu (2013) finds weak effects for other human rights treaties (Convention
34
35 Against Torture (CAT), International Covenant on Civil and Political Rights (ICCPR)) on
36
37 compliance, a pattern also observed by Englehart and Miller (2014). Yet these authors also show
38
39 that CEDAW leads to human rights improvements after ratification, noting that members could
40
41 make "easy" changes quickly after ratification, but fail to move forward with harder reforms in
42
43 women's rights, which would create a plateau in compliance patterns.
44
45
46
47
48
49

50
51 The studies reviewed in this section suggest that CEDAW has created significant
52
53 improvements for women's rights in states that have ratified the treaty. As we discuss in the next
54
55 section, though, the use of reservations by CEDAW members may hinder treaty compliance.
56
57

How Reservations Influence CEDAW Treaty Compliance

The impact of treaty ratification on member states' behavior can be dependent upon the reservations a state places on the treaty. "Reservations allow states to ratify without obligating itself to provisions it does not wish to undertake" (Riddle 2002, 605). Riddle explains that CEDAW has more reservations than any other international human rights treaty. CEDAW allows states to place reservations unless they are "contrary to the object and purpose of the treaty" (Riddle 2002, 613). States apply these reservations through a specific reporting system.³ These reports go to the Committee where they comment on these reservations as well as the progress and measures of the state for implementing the treaty requirements. After ratifying CEDAW, states have twelve months to report these implementations and reservations to the committee and then every four years after. Along with the reservation a state puts on CEDAW, the state must also explain why this reservation is necessary, give examples of how this reservation is consistent with other reservations the state has on treaties, and how the state will limit these reservations in the future (Riddle 2002). States can remove reservations at any time, and many have done so over the years, especially in the face of international pressure (Boyes et al 2023). The map below shows which states ratify the CEDAW treaty with or without reservations.⁴

<Insert map here>

Empirical studies that have examined reservations on CEDAW suggest that their usage may undermine states' compliance with the treaty. Cole (2009) identifies an ordinal scale of

³ Unlike most other treaty areas where reservations can be applied by other states via reciprocity, human rights treaties are not reciprocal because even if a State Member objects to another state's treaty reservations, it does not alter their own obligations under the treaty (Korkelia 2002, 439).

⁴ This map demonstrates the commitment levels of states to CEDAW. It shows states in the year 2021 that have fully ratified, ratified with reservations and then withdrawn those reservations, ratified with reservations, and not ratified the treaty.

1
2
3
4 treaty commitment ranging from signature to ratification with reservations, to ratification without
5
6 reservations. He finds that the level of legal commitment is consequential for treaty compliance.
7
8 Landman (2005) also shows that countries with more serious reservations to the CEDAW treaty
9
10 are less likely to implement its provisions. Similarly, Cho (2014) discovers worsened human
11
12 rights patterns across greater reservation levels, although she notes that CEDAW only influences
13
14 democratic countries' human rights behavior. On the other hand, Englehart and Miller (2015)
15
16 find that the use of reservations did not diminish the effect of CEDAW on women's rights.
17
18
19

20
21 Scholars identify several factors to explain why countries use reservations in human
22
23 rights treaties, including democracy, rule of law, and the depth of commitment to a treaty. First,
24
25 liberal democracies may utilize reservations, understandings, and declarations (RUDs) more
26
27 often than autocratic states because if they take treaty obligations more seriously, they may seek
28
29 to limit compliance on articles they find difficult to implement domestically (Neumayer 2007).
30
31 Simmons' (2009) notes, however, that treaties can be more effective if they mobilize domestic
32
33 constituencies, an effect that is strongest in regimes going through democratic transitions.
34
35 Consistent with this, she finds that CEDAW has a stronger positive effect on improving
36
37 women's rights in transitional regimes.
38
39
40

41 Second, rule of law also influences the use of reservations in human rights treaties.
42
43 "Polities that place a very high value on the rule of law are likely to be especially careful about
44
45 the precise nature of the legal obligations into which they enter" (Simmons 2009, 102). Using
46
47 country ratification episodes for human rights treaties, Simmons' finds that high rule of law
48
49 states are more likely to employ reservations, and that democracies are less likely to do so, once
50
51
52
53
54
55
56
57
58
59
60

1
2
3
4 both factors are accounted for.⁵ Hill (2016) explains that this might occur when the gap between
5
6 domestic law and the behavioral change indicated by the treaty is large, especially in countries
7
8 where domestic judicial enforcement is strong (see also Comstock 2019). Legal traditions can
9
10 also influence the use of reservations, with common law and Islamic law states using them more
11
12 than civil law countries (Simmons 2009; Mitchell and Powell 2011). While Krivenko (2009)
13
14 identifies many reservations used by Islamic law states when ratifying CEDAW, Neumayer's
15
16 (2007) study found a negative relationship between percentage Muslim and the use of
17
18 reservations in CEDAW.
19
20
21

22
23 Finally, treaty design can influence the use of reservations with deeper legal
24
25 commitments creating more incentives for their usage. As Hill (2016, 1131) argues, the use of
26
27 RUDs is more likely when "(1) domestic courts become more powerful and (2) the legal
28
29 obligations the treaty creates are increasingly different from the legal rules that exist ex ante in
30
31 domestic law." Similarly, Zvogbo, Sandholtz, and Mulesky (2020) find that reservations are used
32
33 in human rights treaties frequently on the most demanding treaty provisions that require more
34
35 compliance domestically. Consistent with this, the articles in CEDAW that have the highest
36
37 number of state reservations (Table 6) involve core articles that require more difficult domestic
38
39 changes.⁶ Our theory builds upon these findings, while also considering divergent treaty
40
41 commitments between true compliers and true noncompliers.
42
43
44
45
46
47
48
49

50
51 ⁵ We find a similar pattern in Table A4 where we estimate a Heckman probit model with CEDAW ratification as
52 stage one and the use of reservations as stage two. We show that more democratic countries ratify CEDAW at
53 higher rates and are less likely to place reservations on the treaty. Yet, wealthier states join less often and use more
54 reservations, a pattern consistent with what Simmons observed (2009, 101) for high rule of law states.

55 ⁶ The core articles (2, 7, 9, 16, and 29) have an average of 29 states making reservations versus 7 states making
56 reservations on average for non-core articles (1, 5, 10, 11, 13, 15, 28). Articles with no reservations are excluded
57 from these lists.

THEORY

Historically, reservations were not permitted in treaties. Rather, countries negotiated any objections prior to signing a treaty; this was called the *unanimity rule* (Piper 1985). An alternative perspective developed in 1928 through the Organization of American States which was called the Pan American Rule. This allowed for reservations but created different expectations for relationships among treaty members that used them.⁷ A country that did not accept another state's reservation, for example, created a situation where the dyadic compliance expectation was lower than when dealing with a treaty member without reservations (Swaine 2006, 312).

The International Court of Justice (ICJ) issued an Advisory Opinion in 1951 related to the Genocide Convention that opened the door to the use of reservations in treaties more broadly. Because states feared the Genocide Convention would be applied broadly, they sought to place reservations on its jurisdiction. The ICJ recognized the utility of flexibility in this case, introducing the *compatibility rule* as an alternative to the unanimity rule (Piper 1985, 311). This allowed countries to place reservations on a treaty if they were compatible with the object and purpose of the treaty. This rule was institutionalized in Article 19 of the Vienna Convention on the Law of Treaties and recognized countries' rights to use reservations with three exceptions: "(1) a treaty explicitly prohibits reservations; (2) a treaty limits reservations to specific matters; or (3) a reservation is 'incompatible with the object and purpose of the treaty'" (Buenger 2013-2014, 74).

⁷ "The Pan-American rule provided that if state *A* ratified a treaty including a reservation to which state *B* objected and state *C* accepted, the treaty would be in force between states *A* and *C* subject to the reservation and between states *B* and *C* unrestricted by the reservation. The treaty would not be in force between states *A* and *B*." Piper (1985, 308)

1
2
3
4 Two schools of thoughts emerged in international law regarding the effect of
5
6 reservations. One school of thought, the *opposability approach*, views reservations as
7
8 problematic because they undercut the purpose of international treaties (Piper 1985; Swaine
9
10 2006, 315). This puts the onus on other treaty members to lodge complaints about reservations,
11
12 often within a time frame that is difficult for states to comply with. For example, the CEDAW
13
14 treaty requires states to lodge complaints within twelve months of countries'
15
16 ratification/accession. Furthermore, if reservations are lodged against core articles of a treaty,
17
18 and states do not object due to time or other constraints, this undermines the expected
19
20 compliance of the reserving state with the treaty's terms. According to this perspective, states
21
22 who place reservations on treaties like CEDAW should be less likely to commit genuinely to
23
24 improved women's rights.
25
26
27
28

29
30 The second school of thought, the *permissibility approach*, takes a perspective closer in
31
32 line to the ICJ's 1951 judgement regarding the compatibility rule. By allowing reservations,
33
34 treaties can attract more member states and increase the reach and scope of the agreement. Helfer
35
36 (2006, 378) argues that reservations enhance a treaty's "breadth and depth" and enable the treaty
37
38 itself to become more politically agreeable to more states. Swaine (2006, 329) notes also that
39
40 broadened treaty participation makes it more likely that treaty norms will become customary law.
41
42 He argues that reservations have informational value in that they can indicate areas of potential
43
44 treaty deviance, provide information about domestic constraints (e.g., Sharia law for Islamic
45
46 states), and generate reputational effects. The use of reservations can also identify gaps in
47
48 existing treaty language that could be addressed with additional agreements. More generally,
49
50 reservations create more flexibility in states' treaty commitments, which is often viewed
51
52 positively with respect to treaty compliance (Clark 1991; Koremenos 2005).
53
54
55
56
57
58
59
60

1
2
3
4 We evaluate these two schools of thought on reservations empirically. The opposability
5 approach implies that any use of reservations will be detrimental to states' compliance with the
6 CEDAW treaty. On the other hand, the permissibility approach suggests that the use of
7 reservations may attract more CEDAW members and ultimately change their behavior over time
8 as general customary law and norms shift towards better women's rights and as treaty members
9 are socialized and pressured into better practices. Both perspectives could find support as well
10 given that some states share the treaty's preferences (true compliers), while others find the treaty
11 useful from an instrumental perspective, but do not share its preferences (true noncompliers).
12

23 CEDAW's design incorporates different generational perspectives on women's human
24 rights. The protection of civil and political rights, pieces of two core articles of the CEDAW
25 convention (Articles 2 and 7), accords with the first generation of human rights that were
26 embodied in the Universal Declaration of Human Rights and the ICCPR treaty (Downs 1993).
27 The protection of economic and social rights (e.g., core Articles 9 and 16) reflects the second
28 generation of human rights, as articulated in the International Covenant on Economic, Social,
29 and Cultural Rights (ICESCR). These rights were somewhat in tension during the Cold War as
30 western states promoted first generation human rights and strongly supported the ICCPR treaty,
31 while communist states advocated for the protection of economic rights in the ICESCR treaty.
32 Because CEDAW combines these two generational perspectives on human rights, we anticipate
33 differences in terms of states' women's rights before joining the treaty. For example, communist
34 states might have better economic rights on average, but worse protections for women's political
35 and civil liberties rights. As a result, they might use reservations on the articles that protect
36 women's political rights more frequently. Western states, on the other hand, typically have
37 higher levels of democracy, rule of law, and protection of women's first-generation human
38

59
60

rights, and should be less likely to utilize reservations on the core articles of CEDAW that accord with these rights.

The opposability perspective suggests that true compliers should be less likely to place reservations on the CEDAW treaty's core articles and comply with the treaty at higher levels. Consistent with this argument, we observe that 27.7% of states that ratify CEDAW fully (without reservation) also ratify the Optional Protocol that further solidifies their commitment to the treaty, compared with 17.5% of states that ratify CEDAW with one or more reservations, and 0.6% of non-ratifiers.⁸ As noted earlier, the CEDAW Committee has emphasized in its recommendations to states members that Articles 2, 7, 9, 16, and 29 are the core articles that must be complied with and recommends that any reservations on these articles should be removed. Representing first generation political rights, Article 2 protects women's political and civil liberties, while Article 7 protects women's voting and political participation rights. Representing second generation social rights, Article 9 protects the nationality rights for women and their children, while Article 16 identifies women's rights in marriage and family relations. Countries with better women's rights a priori should be less likely to place reservations on these core articles and more likely to protect women's rights. This hypothesis aligns with the opposability school of thought, viewing reservations as detrimental generally to the effectiveness of an international treaty.

Hypothesis 1: States that ratify CEDAW without reservations are more likely to see improvements in women's human rights than states that ratify with reservations or states who do not ratify the treaty.

⁸ See <https://www.ohchr.org/en/professionalinterest/pages/opcedaw.aspx>. We coded one for each year in our state dataset if the years CEDAW members had ratified the Optional Protocol. Data were coded from the organization's website: <https://indicators.ohchr.org/>.

1
2
3
4 The permissibility perspective suggests that a treaty can attract more members by
5
6 allowing for flexibility in states' commitment levels. That ninety eight percent of all countries
7
8 have ratified CEDAW could be explained in part by the treaty's design allowing reservations. On
9
10 the other hand, reservations on the core political or social articles discussed above should be
11
12 utilized more often by countries that seek the benefits of joining CEDAW but want to limit its
13
14 reach domestically (true noncompliers). We expect that states placing reservations on the treaty's
15
16 core articles should have worse women's rights generally and that their overall compliance with
17
18 the treaty will be lower. Yet, the flexibility embedded in the treaty that encourages participation
19
20 by such states may also create mechanisms for improving their protection of women's rights over
21
22 time. The CEDAW Committee and other CEDAW members provide feedback on these
23
24 reservations, which can create pressure over time for their removal and for implementation of
25
26 domestic legislation to address the underlying rights. We evaluate dynamic patterns for average
27
28 women's rights across time to assess this.
29
30
31
32
33

34 In our discussion of reservations, we noted however that democratic and high rule of law
35
36 states may use reservations on human rights treaties because of the expected high level of
37
38 domestic enforcement. By the time of CEDAW's signature, most western states had generally
39
40 supported the political and social rights embodied in the treaty, and thus they had few incentives
41
42 to place reservations on these core articles. They were less constrained though in using
43
44 reservations on non-core or procedural articles. Article 29, for example, has the highest number
45
46 of state reservations among all CEDAW treaty articles and it concerns procedures for dispute
47
48 resolution. This article states that when two or more parties within a state have a disagreement
49
50 over a violation of CEDAW and it is not settled, they can ask for outside arbitration. If six
51
52 months after this arbitration the parties still cannot agree, they can utilize adjudication and take
53
54
55
56
57

1
2
3
4 the issue to the ICJ. Involving the ICJ often brings in the question of sovereignty to state issues.
5
6
7 If the dispute ever reached the ICJ, the state would have less control over the outcome of the
8
9 dispute. The states that have reservations on Article 29 are willing to ratify CEDAW, but they
10
11 are not willing to stake their sovereignty on their ability to uphold these human rights. The use of
12
13 this procedural reservation is less about the protection of the core principles of the treaty and
14
15 relates more to states' overall position on dispute resolution. By allowing the usage of these
16
17 types of reservations, CEDAW created more flexibility for high rule of law states, which leads to
18
19 our second hypothesis.

30 31 32 **RESEARCH DESIGN**

33
34 To test our theory, we use information on women's political, social, and economic rights from
35
36 the CIRIGHTS Human Rights Dataset from 1981-2019 to assess states' compliance with the
37
38 CEDAW treaty (Mark et al. 2023). If the treaty works as designed, then member states should
39
40 implement better policies and laws to protect women's rights after joining CEDAW, a pattern
41
42 observed with aggregate time series data (Englehart and Miller 2014). CIRIRIGHTS analyzes 15
43
44 internationally recognized human rights for around 200 countries. The project codes women's
45
46 economic, social, and political rights annually on a scale of zero (worst) to three (best).⁹
47
48
49
50
51
52
53

54
55 ⁹ CIRIGHTS generates scores based on states' human rights practices (rather than stated policies) using information
56 on annual human rights reports from Amnesty International and the US State Department. See <https://cirights.com/>.
57

1
2
3
4 Women's *political rights* include women having the right to vote, to run for office, to
5 hold elected and appointed governmental positions, to join political parties, and to petition
6 governmental officials (Mark et al. 2023). Regarding women's *economic rights*, CIRIGHTS
7 analyzes whether women get equal pay for equal work, free choice of profession without the
8 need to obtain husband or a male relative consent, the right to gainful employment without
9 husband or male relative consent, equality in hiring and promoting, job security, non-
10 discrimination by employers, the right to be free from sexual harassment in the workplace, the
11 right to work at night, the right to work in occupations classified as dangerous, and the right to
12 work in the military or the police force (Mark et al. 2023). Based on countries' practices on these
13 various dimensions of women's rights, they receive a score on an ordinal scale from no rights
14 (zero), to some unenforced rights (one), to some enforced rights (two), to full rights (three).

30 Although CIRIGHTS has a social rights measurement, it covers only years since 2005.
31 Therefore, we use the V-Dem women's civil liberties index as our social rights proxy (Coppedge
32 et al 2023). The V-Dem women's civil liberties index is comprised of four questions including
33 freedom of domestic movement for women, freedom from forced labor for women, property
34 rights for women, and access to justice for women. This variable is on a zero to one scale with
35 one being the highest level of civil liberties for women in a state.¹⁰

51
52

53 ¹⁰ The V-Dem and CIRIGHTS social rights measures are correlated at 0.53.

54 ¹¹ The social rights indicator in this table is from CIRIRIGHTS and not the social indicator from V-Dem used in our
55 multivariate models. This measure only spans from 2005 to 2021, which is why we employ a V-Dem indicator in
56 our broader analyses. Table A3 in the Appendix presents descriptive statistics for the dependent variables.
57

rights, on the other hand, are enforced or fully enforced by only 35% of states. Social rights are in the middle with 54% of countries showing some or full rights (since 2005).

To measure the level of CEDAW commitment, we collect original data from the United Nations Treaty Collection series capturing ratification (or accession), along with reservations that countries place on their treaty commitments. When ratifying a treaty, “a state indicates its consent to be bound to a treaty if the parties intended to show their consent by such an act. The institution of ratification grants states the necessary timeframe to seek the required approval for the treaty on the domestic level and to enact the necessary legislation to give domestic effect to that treaty” (UNTC 2019). A reservation is “a declaration made by a state by which it purports to exclude or alter the legal effect of certain provisions of the treaty in their application to that state.” (UNTC 2019). These reservations can be against any article or paragraph of the CEDAW treaty and can be enacted at any point by member states. We do not include declarations in our coding of reservations, unless they explicitly call for a reservation on a specific article of CEDAW.¹²

Table 2: Women’s Rights in CIRIGHTS Data

Percentage of State Years			
CIRIGHTS Level	Political	Social	Economic
No Rights	4%	18%	11%
Some Unenforced Rights	18%	28%	54%
Some Enforced Rights	67%	31%	28%
Full Rights	11%	23%	7%
N	6449	2934	6339

¹² In Table A3, we add a dummy variable to our main models indicating if a reservation was made through a declaration and our results are robust. On the importance for RUD distinctions, see McKibben and Western (2020) and Zvogbo, Sandholtz, and Mulesky (2020).

1
2
3
4 For example, in 1981, Egypt placed a reservation on Article 2 of CEDAW related to
5 political discrimination: “The Arab Republic of Egypt is willing to comply with the content of
6 this article, provided that such compliance does not run counter to the Islamic *Sharia*.” Egypt
7 also placed reservations on Article 16 (marriage and family relations) and Article 29 (dispute
8 resolution procedures). One or more CEDAW member states have placed reservations on
9 political (Articles 2, 7, 15), economic (Articles 11, 13), social (Articles 5, 9, 10, 16), procedural
10 (Articles 28, 29), and general human rights provisions (Article 1) in the treaty (see Table 6). We
11 code reservations for each country in each year on every CEDAW treaty article and then
12 aggregate that information to indicate whether a country has one or more reservations in place
13 each year.
14
15
16
17
18
19
20
21
22
23
24
25
26

27 A state was coded as a zero if it did not ratify CEDAW, one if it ratified CEDAW with
28 reservations, and a two if it ratified CEDAW with no reservations. This ordinal scale was used to
29 generate two dummy variables: *States with Reservations* and *States without Reservations*. As
30 noted earlier, thirty one percent of states ratifying CEDAW place reservations on their treaty
31 commitments. Overall, non-ratifying states make up twenty four percent of our state year
32 observations (1981-2019), *States with Reservations* comprise twenty four percent of our
33 observations, while *States without Reservations* make up fifty two percent of the cases. Because
34 states can choose to enact or retract reservations at any point in time, we capture these behavioral
35 shifts in our state year dataset.
36
37

42
43
44
45
46
47

48 We include several control variables following other studies that assess the effect of
49 CEDAW commitments on women’s rights (Hill 2010; Lupu 2013). This includes measures for
50 civil war and interstate war, population size (natural log), regime type (Polity IV -10 to +10
51 scale), wealth (real GDP per capita), women’s involvement in civil society organizations, and
52
53
54
55
56
57

1
2
3
4 domestic legal traditions (common law, civil law, Islamic law).¹³ We anticipate that democratic
5 and wealthier states will have better women's rights, while larger states participating in wars will
6 have worse rights. Common law states have better human rights in general than other legal
7 traditions (Simmons 2009; Mitchell, Ring, and Spellman 2013).
8
9
10
11
12

13
14 We test hypothesis 1 with two modeling strategies. First, we use an ordered logit model
15 which captures the ordered nature of the CIRIGHTS dependent variables. We cluster the
16 standard errors by country and include a variable for year to capture non-independence in our
17 data. For the analyses using the V-Dem social rights measure, we estimate a GLS random effects
18 regression model. Using an empirical estimation strategy like Simmons (2009), we also estimate
19 an instrumental variables model (Table A1) with CAT ratification as an instrument. Second, we
20 estimate a Heckman selection model to capture the non-random selection process by which
21 countries join human rights treaties like CEDAW. Stage one captures ratification of CEDAW
22 (0/1), while Stage two codes states' women's rights levels on the CIRIGHTS or V-Dem scales.
23
24 The correlation between the two stages of the model captures the relationship between
25 unobserved factors that influence treaty joining and women's rights. For example, a negative
26 correlation between the models' errors would imply that unobserved factors that promote joining
27 CEDAW are negatively related to factors that promote better women's rights. A negative
28 correlation is consistent with at least some countries joining human rights treaties for expressive
29 or "window-dressing" purposes (Hathaway 2002).

52
53 ¹³ Civil and interstate war measures are from the Major Episodes of Political Violence Dataset;
54 <https://www.systemicpeace.org/inscr/MEPVcodebook2018.pdf>. Population size and wealth are updated through
55 2019 using Whitten-Woodring's (2015) replication dataset. The women's civil society organizations measure is
56 taken from V-Dem. Legal tradition data comes from Mitchell and Powell (2011), while Polity data comes from
57 <https://www.systemicpeace.org/inscrdata.html>.
58

1
2
3
4 To evaluate hypothesis 2, we compare states' average political, social, and economic
5 women's rights based on the articles that receive reservations in the CEDAW commitment
6 process. Our expectation is that states with better women's rights will use non-core or procedural
7 reservations more often, while states with worse women's rights will place reservations on
8 articles that are central to the overall mission of the CEDAW treaty. If confirmed, the use of
9 reservations is most detrimental to countries most in need of treaty-induced improvements.

13
14
15
16
17
18
19

20 DATA ANALYSIS

21
22 Our study seeks to determine how different levels of commitment under CEDAW influence
23 compliance with the treaty in terms of states' overall record on women's human rights. In Table
24 3, we present baseline models with the CEDAW commitment independent variables but include
25 no other control variables. Consistent with our theory (Hypothesis 1), we find that countries
26 ratifying CEDAW without reservations have significantly higher political and social rights for
27 women compared to states who do not ratify the treaty. The coefficients for *States with*
28 *Reservations* are also positive and significant in the first two models, showing that CEDAW
29 members have better women's human rights records overall than non-CEDAW members. Yet
30 the coefficients are smaller than those observed for *States without Reservations*. Therefore, we
31 can conclude that states that ratify CEDAW without reservations are more likely to see
32 improvements in women's human rights than states that ratify with reservations or states that do
33 not ratify. However, the effects for economic rights show are distinct; countries ratifying
34 CEDAW with reservations have better economic rights for women than those ratifying without
35 reservations. Our empirical findings suggest that for political and social rights, the opposability

perspective holds, and for economic rights, the permissibility perspective holds. This also reflects different support levels for second generation economic rights that emerged in the Cold War.

Table 4 presents the ordered logit (political, economic) and regression (social) models with control variables added. Like the results in Table 3, countries most committed to CEDAW (*States without Reservations*) have significantly better political and social women's rights. However, the states that place reservations on their commitments do not have significantly different human rights behaviors from states that do not join CEDAW. Thus, once we control for other factors that influence human rights behavior, countries that join CEDAW with reservations are not that different from non-CEDAW joining states in the protection of women's political and social rights. Economic rights show a similar pattern to the baseline model, whereby countries that place reservations have higher economic rights on average than states that fully ratify or eschew the treaty.

Substantive Effects

We present the substantive effects for our key independent variables in the full model (Table 4) in Figures 1 (Political Rights), 2 (Social Rights), and 3 (Economic Rights).¹⁴ First, the probability of some enforced political rights for women increases across the level of commitment categories. States ratifying CEDAW without reservation are 6.6 percent more likely to observe some enforced political rights for women than states who do not join CEDAW (and 2.4 percent more likely than states who join the treaty with reservations). We also see movement in the "Some Unenforced Rights" political rights category, with non-ratifying states being seventy three percent more likely to be in this category than countries who ratify CEDAW without reservations. Those who ratify with reservations are thirty two percent more likely to have some

¹⁴ These graphs are generated using the margins command in Stata and setting all other variables at their mean.

1
2
3
4 unenforced political rights for women than states ratifying without restrictions. We see some
5
6 movement in the “No Rights” and “Full Rights” categories even though there are fewer countries
7
8 in those categories (forty six percent and eighty six percent; see Table 2). As anticipated by the
9
10 opposability perspective, the use of reservations reduces states’ compliance with CEDAW
11
12 provisions.
13
14

15
16 <Figure 1 here>
17

18 Figure 2 shows similar patterns for social rights. States that ratify CEDAW without
19
20 reservations see eight percent higher social rights, although states not ratifying CEDAW have
21
22 slightly better social rights. For economic rights (Figure 3), the likelihood of enforcing some
23
24 rights increases across treaty commitment levels. States ratifying without reservations are
25
26 eighteen percent less likely to have no rights and four percent less likely to have some
27
28 unenforced rights. While some enforced economic rights increase across treaty commitment
29
30 levels, full rights are slightly less likely to be observed at the highest level (although the
31
32 differences are small).
33
34

35
36 This demonstrates that commitment level matters for women’s political, social, and
37
38 economic rights. Consistent with the opposability school of thought, the use of reservations
39
40 reduces states’ compliance with the CEDAW treaty. However, we also observe that states that
41
42 join with reservations often have better women’s rights than states who do not support the treaty.
43
44 Consistent with Goodliffe and Hawkins’ (2006) theory of “lock-in,” states may want to signal to
45
46 the international community that they value this communal idea that women should be treated as
47
48 equals, but they may also use reservations on articles that are inconsistent with their preferences.
49
50
51 When they ratify with reservations, they are holding themselves responsible, in some parts, to the
52
53

4 CEDAW Committee and must show how they are improving women's rights within their state,
5
6 leading to the increases shown in Figures 1-3.
7

8 <Figure 2 here>
9

10 <Figure 3 here>
11

12 *Illustrative Cases* 13

14
15 Several cases in our dataset are consistent with our theory. Several states that had not
16 previously ratified CEDAW, then ratified the treaty without reservations, improved their
17 women's political rights. For example, San Marino fully ratified CEDAW in 2003 and moved
18 from a one to a two on the women's political rights scale the following year. The same was also
19 found in Kenya in 1984 when the country ratified CEDAW without any reservations and moved
20 from a one to a two on the CIRIRIGHTS political rights scale in 1985. This trend can be seen in
21 other ratifying states such as Georgia, the Ivory Coast, Peru, Paraguay, and Spain. All countries
22 fully ratified CEDAW and experienced improvements in women's political rights within two
23 years of their ratification.
24
25
26
27
28
29
30
31
32
33
34
35

36 Our theory is also exemplified by states that ratify with reservations, then remove those
37 reservations, achieving higher CIRIGHTS women's political rights scores after full ratification.
38 This is exemplified by Belgium, who ratified with reservations in 1985 with a score of two on
39 the women's political rights scale and then fully ratified the treaty in 2002, gaining a ranking of
40 three on the women's political rights scale in 2003. Austria also ratified CEDAW with
41 reservations in 1982, and then fully ratified the treaty without any reservations in 2015. The
42 following year, Austria moved from a two to a three on the CIRIGHTS women's political rights
43 scale. This trend can also be seen in the Czech Republic and Luxembourg both moving up on the
44 CIRIGHTS scale shortly after full ratification. In summary, we see dynamic patterns in CEDAW

4 members' protection of women's rights that show how a permissibility approach to the treaty can
5
6 improve compliance over time.
7

8
9 However, our empirical findings also show that such reservations are designed to limit
10 full compliance with the treaty. Countries must provide reports on how they are enforcing the
11 treaty and working to improve women's rights overall. If a state has "unenforced" norms of
12 treating women a certain way, they may not want to put the infrastructure and cost into changing
13 those norms into laws. This helps us understand why states place reservations on the articles of
14 the treaty in areas where they have "unenforced" norms, and why their overall human rights'
15 protections for women are worse than countries joining CEDAW without reservations.
16
17

25 *Aggregate Dynamic Patterns for Women's Human Rights' Protections*

26
27 While true noncompliers may ratify a human rights treaty as a signaling ("window-
28 dressing") mechanism to the international community, such states may improve compliance
29 levels with the treaties over time due to institutional and membership pressures (Avdeyeva 2007;
30 Englehart and Miller 2014). To explore these aggregate dynamic patterns of the permissibility
31 approach, we plot the average women's rights scores globally for political (Figure 4a), social
32 (Figure 4b), and economic (Figure 4c) rights. Consistent with our theory, we see that political
33 rights show stronger improvements over time for the set of countries that ratify CEDAW fully
34 without reservations (by a half point on the zero to three scale in total). States that exemplify this
35 pattern include Rwanda and Uganda, as both countries ratified CEDAW without reservations and
36 achieved significant gains in women's rights over time. On the other hand, states that employ
37 reservations do not see the same improvements in political rights. For example, Tunisia ratified
38 CEDAW with four reservations (articles 9, 15, 16, and 29) and experienced no significant
39 improvements in women's rights over time.

59
60

1
2
3
4 Average social rights are similar in the early years of the CEDAW treaty, but we see
5
6 divergence over time as states that joined the treaty with reservations show declines in average
7
8 protections of women's social rights (by a tenth of a point on the V-Dem scale). The aggregate
9
10 patterns for economic rights (Figure 4c) are consistent with our ordered logit model in that states
11
12 with reservations tend to have higher economic rights on average, although the trend reverses in
13
14 more recent years. We see though that the treaty has the desired effect on all states over time,
15
16 manifesting mostly improvements in the protection of women's rights. In this regard, allowing
17
18 reservations in the permissibility perspective may improve human rights protections in true
19
20 noncomplier states, but not fully close the gap with true compliers.
21
22
23

26 <Figure 4b here>

27 <Figure 4c here>

28 29 30 31 32 *How Women's Rights at Treaty Formation Influence Dynamic Patterns*

33
34 To see how initial women's rights at CEDAW treaty formation influenced dynamic
35
36 changes in rights over time, we estimated time series graphs separately for states that had lower
37
38 women's political rights scores in 1981 (zero and one) and states that had higher women's rights
39
40 scores the same year. We traced changes in women's rights over time for these groups broken
41
42 into the three CEDAW commitment levels. Countries that had lower political women's rights
43
44 when the CEDAW treaty was first signed show similar patterns to the overall sample in Figure
45
46 3a for political rights (Figure A1a). States that ratified CEDAW without reservations show
47
48 continual improvements over time and maintain higher average levels of women's political rights
49
50 than states that ratified CEDAW with reservations. Among states in the lower human rights
51
52 group in 1981, social rights improve steadily for states ratifying without reservations, while
53
54
55
56
57
58
59
60

1
2
3
4 countries joining with reservations see erosion of social rights over time (Figure A1b). Finally,
5 economic rights show similar patterns to the all-states sample, with rights being higher for states
6 with reservations (Figure A1c). Figures A2a-A2c show similar time series patterns for countries
7 that were higher on women's rights when the CEDAW treaty opened for signature. Among this
8 set of states, there are more improvements for political and social rights over time for the fully
9 ratifying (without reservation) countries compared to the states ratifying with reservations
10 (Figure A2a, A2b). Economic rights do not show noticeable gains for this group though, and
11 often show states with reservations having better human rights (Figure A2c). This fits with our
12 theory about distinct behavior for true compliers and true noncompliers in human rights treaties.

25 *Selection Effects*

26
27 However, states do not randomly join human rights treaties. In Table 5, we present
28 Heckman selection models that control for state selection into CEDAW in stage one, while
29 examining how reservations influence women's rights protection in stage two (among the
30 ratifiers). Consistent with our ordered logit and regression models, we observe that CEDAW
31 states with reservations have worse political and social rights than countries that fully support the
32 treaty. Economic rights for ratifying states with reservations are better than for those ratifying
33 out reservations, consistent with our earlier analysis (Table 4). Countries that participate in
34 interstate, have higher GDP per capita and are common law states are less likely to ratify
35 CEDAW, while democratic and civil law countries with more women's civil society
36 organizations are more inclined to join. In Table A1, we present results for our main models
37 using CAT ratification as an instrument for CEDAW ratification. We get similar results, namely
38 that states without reservations have better political and social rights but see no significant
39 improvements in economic rights.

Testing Hypothesis 2

In Table 6, we present information on each CEDAW article that has one or more state reservations, along with the mean women rights' scores for CEDAW ratifiers with (Yes) or without (No) reservations. We expect true compliers (with better women's rights) to implement reservations on procedural (or non-core) articles, while true non-compliers with worse rights will be more likely to place reservations on the core articles of CEDAW, or those that specifically focus on the improvement of women's rights within the country (e.g., Articles 2, 7, 9, 16).

The data supports this pattern. First, we note that Article 28, which is a procedural article about reservations, is used by countries with better political, social, and economic rights. On the other hand, Article 29 shows the reverse pattern, with reservations employed by countries who score lower on average on women's rights. Although high rule of law states might seek to limit arbitration or ICJ adjudication for disputes arising in the context of the treaty, it appears that states with worse women's rights also seek to limit the role of outside authorities for dispute settlement. Given that only a third of countries accept the compulsory jurisdiction of the ICJ (Mitchell and Powell 2011), it is not surprising that Article 29 receives the largest number of reservations overall. Furthermore, the CEDAW Committee has viewed reservations on Article 29 as a violation of a core provision of the treaty (De Pauw 2013), thus it follows that countries with worse women's rights would be more likely to employ such a reservation.

Second, we also see that countries with worse women's human rights records are significantly more likely to place reservations on CEDAW articles that are seen as core to the treaty's success. Article 2 reservations demonstrate this pattern, often being used by Islamic law states who seek to limit any conflicts between protection of women's political rights and Sharia law. In addition to Egypt employing an Article 2 reservation as described earlier, many other Islamic law states such as Iraq, Libya, and Morocco have similar reservations on this clause. We see a similar pattern for Article 9 (nationality rights). States that use reservations on Article 7 (political rights) or Article 16 (marriage and family relations) have worse political rights than states ratifying CEDAW without reservations. States with better economic rights use reservations in 8 or 12 cases, which fits with our discussion earlier of these second-generation rights being supported by a distinct group of countries, although not as often on core CEDAW articles.

Our empirical analyses demonstrate that level of commitment is important when looking at the effectiveness of CEDAW within a state, and that states with worse human rights records more often place reservations on the important articles that comprise the fundamental values of the convention. This information also addresses an issue with looking at ratification of human rights treaties. Often, social scientists find that states that are likely to ratify human rights treaties are democratic in nature and share the values of the institutions that create these treaties. These states already have these values; therefore, we should see higher human rights levels. The same can also be said for states that do not share the values of these institutions, they will likely not ratify these treaties. While we show that states with worse human rights use reservations to prevent CEDAW from having far reaching effects in domestic society, we do observe that such states have better records compared to non-ratifying states. Furthermore, a lot of movement in human rights occurs for states in the middle of the CIRIGHTS scales. The process of removing

¹⁵ The values represent the means for each group among CEDAW ratifying members with (Yes) and without (No) the reservation on the listed treaty article. An asterisk indicates the t-test for the difference of means between groups produces a calculated value greater than the 90 percent critical t-score; two asterisks indicate significance for the difference of means test at the ninety five percent level, while three asterisks indicate significance for the difference of means test at the ninety nine percent level. Articles in italics are considered by the CEDAW Committee to be core articles (De Pauw 2013).

¹⁶ Omitted articles (e.g., Articles 3, 4, 6, 8, and 17-27) have no CEDAW member state reservations.

CONCLUSION

We demonstrate that the level of legal commitment to an international human rights treaty matters for assessing states' compliance with the treaty. Our results are consistent with the opposability view of treaty reservations whereby states that ratify CEDAW without reservations have better women's political and social rights than states that fully ratify with no reservations. These countries also maintain a gap in terms of better rights' respect over time compared to countries ratifying CEDAW with reservations. However, we also show that the flexibility of the CEDAW treaty regime encourages participation and improves rights over time, consistent with the permissibility perspective of reservations. States with reservations have better economic rights, which is consistent with a permissibility perspective and reflects different level of support for the second generation of economic rights that emerged in the Cold War. We also find that CEDAW members using reservations often remove them in the face of international pressure, showing how the regime can improve behavior even for countries that use reservations. High rule of law countries also take advantage of the treaty's flexibility to place reservations on procedural aspects of the treaty's implementation.

While studying CEDAW reservations is valuable given that it has the most reservations among any human rights treaties, future research would also benefit from exploring reservations in other human rights treaties such as CAT and ICCPR to see if there is a detrimental impact of reservations on treaty compliance. Many studies suggest these treaties do not have significant effects on human rights practices in the states that ratified them. However, between ten and fifteen percent of CAT and ICCPR treaty signatories place reservations on their treaty commitments (Neumayer 2007). It would be useful to compare states with and without reservations in other human rights treaties to see if states ratifying with reservations have more

1
2
3
4 frequent torture or worse political rights. This research could also be furthered by seeing where
5 reservations are placed in CAT, ICCPR, or other human rights treaties and whether such
6
7 reservations are on core provisions of the treaties or on general or other procedural articles. As
8
9 shown with our CEDAW analyses, reservations on core articles of the treaty are more often used
10
11 by non-compliant states.
12
13
14

15
16 Future research should also examine the content of article provisions because the
17
18 provisions of human rights treaties can vary in terms of the obligations they entail (Zvogbo,
19
20 Sandholtz, and Mulesky 2020). Although we acknowledge their importance to reservations held
21
22 on CEDAW, we did not explore how the content of different provisions may factor into how and
23
24 when states place reservations. Using text analysis or a specific subset of reservation type could
25
26 help human rights scholars understand why reservations are placed and why they are removed,
27
28 building upon recent work in this area.
29
30

31
32 It would also be useful to examine the timing of reservations in more detail. Helfer
33
34 (2006) argues that the timing of reservations can show a lot about how the state is willing to
35
36 commit. A state that puts reservations on a treaty as soon as they sign signals they will cooperate,
37
38 but only on their terms. Helfer (2006) also explains that states that ratify the treaty sometime
39
40 after its creation are more likely to put more reservations on it than states that ratified
41
42 immediately. This could possibly explain the level of commitment from states and what to
43
44 expect depending on when they ratify. The timing of reservation removal is also an interesting
45
46 topic to explore, with research showing that other states' objections on CEDAW reservations
47
48 create incentives for the partial removal of states' reservations to the treaty (Kreutzer 2023). We
49
50 could also examine domestic enforcement mechanisms beyond legal traditions such as rule of
51
52 law and judicial independence (Powell and Staton 2009).
53
54
55
56
57
58
59
60

1
2
3
4 Human rights treaties, such as CEDAW, are imperative for improving women's rights.
5
6
7 We show, though, that states' levels of legal commitment to human rights treaties have
8
9 significant consequences for their willingness to improve human rights practices and that the use
10
11 of treaty reservations undermines state members' compliance. Our research adds to the overall
12
13 narrative of human rights and aids in the fight for more freedoms for underrepresented
14
15 populations around the world.

1
2
3 Memo for “The Three R’s of CEDAW Commitment: Ratification, Reservation, and Rejection”
4 ID: 235185453.R1
5

6
7 We have revised the manuscript so that it conforms with ISA style guidelines. We left references
8 to hypotheses and treaty articles as numeric, but changed all other numbers to text (e.g., two).
9

10 We moved the figures to the end of the document on separate pages for each figure.
11

12 We have compiled a replication dataset and do file in Stata format and emailed the files to
13 ijjournalpitt@gmail.com.
14

15
16 In response to reviewer 2, we note that on pages 16-17 that our dataset comes from
17 CIRIRIGHTS. In footnote 11, we explain: “The social rights indicator in this table is from
18 CIRIRIGHTS and not the social indicator from V-Dem used in our multivariate models. This
19 measure only spans from 2005 to 2021, which is why we employ a V-Dem indicator in our
20 broader analyses...” So yes, the reason we do not use the CIRIRIGHTS Social Rights data in our
21 analyses is because the data does not exist before 2005, while our time period is 1981 to 2019 (as
22 noted on page 16). We do, however, use CIRIRIGHTS in Table 2 because we want the three
23 indicators to have the same ordinal scale for comparison. The V-Dem scale is a continuous latent
24 measure and thus would be difficult to compare to the other two ordinal measures
25 (descriptively).
26
27

28
29 In response to reviewer 2, we also added text to the first paragraph in the conclusion on page 32
30 to highlight our contributions more clearly. In terms of our patterns that vary across rights
31 (political, economic, and social), we believe our literature review and empirical analysis sections
32 adequately connect our patterns to those other findings.
